<u> </u>			
Alert	Most often given in conjunction with calcium for the preventi	on and treatment of metabolic bone	
	disease in preterm infants.		
	1 mmol phosphorus/phosphate (P) = 31 mg elemental phosph	iorus.	
	1 mmol elemental calcium (Ca) = 40 mg elemental calcium.		
	Separate oral doses from calcium supplements by at least 1 h		
	When using IV preparation, always check plasma sodium and		
	choosing the right phosphate preparation (e.g. sodium or pot	assium phosphate preparation).	
Indication			
	Treatment of hypophosphataemia.		
	Supplementation to meet the recommended daily intakes.		
Action	Phosphorus is a major intracellular mineral and is important in	n bone mineralisation and energy	
	production.		
Drug Type	Mineral		
Trade Name	IV		
	Glycophos® Concentrated injection solution for infusion (Fres	enius-Kabi) (recommended organic	
	preparation)		
	Each 1 mL of Glycophos <sup>®</sup> corresponds to 1 mmol phosphate a	nd 2 mmol sodium.	
	Sodium dihydrogen phosphate Phebra IV (Preferred inorganic		
	Each 1 mL vial corresponds to 1 mmol phosphate, 1 mmol soc	lium and 2 mmol hydrogen.	
	Potassium dihydrogen phosphate concentrated injection DBL		
	Potassium dihydrogen phosphate concentrated injection Phel		
	Each 1 mL ampoule corresponds to 1 mmol phosphate, 1 mm	ol potassium and 2 mmol hydrogen.	
	ORAL		
	Phosphate-Phebra <sup>®</sup> oral effervescent tablets		
	Each tablet contains: 16.1 mmol phosphate (equivalent to 500	0 mg elemental phosphorus); 20.4 mmol	
	sodium; 3.1 mmol potassium		
	Sodium dihydrogen phosphate Phebra IV (preferred IV prepar		
	Each 10 mL vial (sodium dihydrogen phosphate 1.56 g) contai	ns: 10 mmol phosphate; 10 mmol sodium;	
	20 mmol hydrogen		
		n. <i>t</i>	
	Potassium dihydrogen phosphate concentrated injection DBL		
Potassium dihydrogen phosphate concentrated injection Phebra IV			
	Each 10 mL ampoule (potassium dihydrogen phosphate 1.361	. g) contains: 10 mmol phosphate; 10 mmol	
<u> </u>	potassium; 20 mmol hydrogen		
Presentation	IV: Glycophos 20 mL ampoule; Sodium dihydrogen phosphate	e 10 mL vial; Potassium dihydrogen	
	phosphate concentrated injection 10 mL ampoule.		
	<b>Oral:</b> 500 mg effervescent tablets; IV preparation (e.g. sodium	n or potassium dihydrogen phosphate) can	
	be given orally.		
Dose	Treatment of metabolic bone disease (MBD)		
Dose	Treatment of metabolic bolle disease (MDD)		
	PO: 1 to 3 mmol/kg/day in 2-4 divided doses as an ac	dition to intake from milk and other	
	sources to a maximum intake of 4.5 mmol/kg/day.		
	Use either Sodium dihydrogen phosphate Phebra IV preparation or Phosphate-Sandoz tablets.		
	General principles of treatment of MBD:		
	A. Commence at low dose (e.g. 1 mmol/kg/day) an	d titrate the dose up as tolerated	
		-	
	B. Given in conjunction with calcium supplementat		
	AM, 2 PM, 8 PM and Phosphorus 6 AM, 12 MD,	-	
	C. Aim to reach the upper end of the recommende	d intake: Ca 5 mmol/kg/day and P 4.5	
	mmol/kg/day. <sup>8</sup>		
ANMF Consensus Gr	oup Phosphorus	Page 1 of 6	

	D. Dose can be adjusted with a goal of slight excess supply aiming for urinary calcium	
	$\geq$ 1.2mmol/L and phosphate $\geq$ 0.4 mmol/L.	
	Treatment of acute hypophosphataemia	
	IV: 0.2 mmol/kg/dose [range 0.15–0.33 mmol/kg/dose] over 6 hours. Repeat as necessary. Aim	
	to maintain normophosphataemia of 1.8–2.6 mmol/L (5.6–8.1 mg/dl).	
	Daily enteral Supplementation to meet the recommended daily intakes (RDI)	
	2–4.5 mmol/kg/day (62–140 mg/kg/day of phosphorus) <sup>7,8</sup>	
	1. Calculate intake from parenteral and enteral sources	
	2. Supplement the difference via IV or oral route.	
Dose adjustment		
Maximum dose		
Total cumulative dose		
	PO	
	IV	
-	IV infusion for treatment of acute hypophosphataemia: IV infusion (Glycophos): Draw up 1 mL (1 mmol phosphate) and add 19 mL sodium chloride 0.9% or	
	water for injection to make a final volume of 20 mL with a concentration of 0.05 mmol/mL. Draw up 4	
	mL/kg (0.2 mmol/kg).	
	IV infusion (sodium dihydrogen phosphate): Draw up 1 mL (1 mmol phosphate) and add 19 mL sodium	
	chloride 0.9% or glucose 5% to make a final volume of 20 mL with a concentration of 0.05 mmol/mL.	
	Draw up 4 mL/kg (0.2 mmol/kg).	
	IV infusion (potassium dihydrogen phosphate): Draw up 1 mL (1 mmol phosphate) and add 24 mL sodium	
	chloride 0.9% or glucose 5% to make a final volume of 25 mL with a concentration of 0.04 mmol/mL.	
	Draw up 5 mL/kg (0.2 mmol/kg).	
	Oral	
	Option 1 (preferred option for infants going home or when a long storage time is required in the NICU):	
	Disperse 500 mg (16.1 mmol) Phosphate effervescent tablet in 16 mL of water for injection to make a	
	solution with a concentration of 1 mmol/mL.	
	Option 2 (can be used where preparation with low osmolality is preferred e.g. infants with history of feed	
	intolerance): IV sodium dihydrogen phosphate decanted into a bottle and given orally undiluted (expiry	
	time: 7 days).	
Administration	Oral	
	Can be administered with feeds (refer to evidence summary section).	
	Separate calcium supplements by at least 2 hours.	
	N/	
	IV As part of parenteral nutrition fluid – refer to individual parenteral nutrition formulations.	
	As part of parenteral nutrition nutrice refer to individual parenteral nutrition formulations.	
	IV infusion for treatment of acute hypophosphataemia:	
	IV glycophos: Infuse over at least 8 hours.	
	IV sodium dihydrogen phosphate or IV potassium dihydrogen phosphate: Infuse over at least 6 hours.	
	For severe hypophosphataemia infuse over 8–12 hours. Maximum infusion rate of 0.2 mmol/kg/h.	
	Phosphate, calcium, magnesium, alkaline phosphatase concentrations are required at least fortnightly or	
_	more often if required. Once these concentrations normalise, serum analysis may be performed once	
	monthly for 6 months or at the discretion of the clinician. <sup>10</sup>	
	Urinary calcium and phosphate and Tubular Reabsorption Phosphate (TRP)%, parathormone, and vitamin	
	D concentrations may be useful under certain circumstances .	

## Phosphorus Newborn use only

Contraindications	Hyperphosphataemia, dehydration, se	vere renal insufficiency, shock.	
Precautions	Hypernatraemia (avoid sodium dihydrogen phosphate).		
	Hyperkalaemia (avoid potassium dihyc	lrogen phosphate)	
Drug Interactions			droxide etc.) reduce phosphate
	absorption — separate doses by at lea		
	Additive effects with other drugs that may prolong QT interval. Potassium dihydrogen phosphate preparation may increase the risk of hyperkalaemia when used conjunction with potassium sparing diuretics (e.g. spironolactone).		
			of hyperkalaemia when used in
Adverse	Diarrhoea (oral use only), hypocalcaen	nia, nephrotoxicity, prolonged	QT interval, hypotension,
Reactions	hypomagnesaemia.		
	Hyperphosphataemia – carpopedal spasm, seizures. <sup>2</sup>		
Compatibility	<u>Glycophos</u>		
	Fluids: Sodium chloride 0.9%, water fo	r injection, glucose 5%.

		salts ketamine lorazenam ma	agnesium salts, rocuronium
	Drugs: Aciclovir, amiodarone, calcium salts, ketamine, lorazepam, magnesium salts, rocuronium. Solutions that contain other cations such as calcium, magnesium, iron and aluminium may also		
	precipitate.		
	Sodium dihydrogen phosphate		
	Fluids : No information Drugs: Aciclovir, amiodarone, calcium salts, calcium, aluminium or magnesium, iron and magnes containing solutions.		
			agnesium, iron and magnesium
Stability	Preparation from oral effervescent tablets: It is to be used immediately after preparation and discard unused portion. Oral preparation from IV sodium dihydrogen phosphate: 7 days		ely after preparation and discard
	Glycophos: To be used within 24 hours after reconstitution.		
Storage	Store below 25°C.		
Excipients	Phosphate-Phebra® oral effervescent tablets: Sodium bicarbonate, potassium bicarbonate, macrogo		otassium bicarbonate, macrogol
	4000, citric acid, sucrose, orange 52570 TP0551 and saccharin sodium.		
	Glycophos: Hydrochloric acid and wate	er for injections.	
Special			
Comments			
Evidence	Recommended daily intakes (RDI)		
	Phosphorus absorption is typically 80% to 90% of dietary intake. <sup>3</sup>		
	Parenteral intake: Previously, the recommended doses of parenteral Ca and P in preterm infants varied		
	from 1.3–3 mmol Ca/kg/day and 1.0–2.3 mmol P/kg/day, with a Ca:P ratio in the range of 1.3–1.7. <sup>1,4-6</sup>		
	ESPGHAN 2018 updated guidelines on parenteral nutrition recommends the following Ca and		
	Phosphate: <sup>12</sup>	· ·	1 1
		Parenteral Ca	Parenteral Ph
		mmol (mg)/kg/day	mmol (mg)/kg/day
	Preterm during the first days of life	0.8-2.0 (32-80)	1.0-2.0 (31-62)
	Growing preterm	1.6-3.5 (100-140)	1.6-3.5 (77-108)
	Term neonate	0.8-1.5 (30-60)	0.7-1.3 (20-40)

2021

		rition recommend 2–3 mmol/kg/day of a hi
absorbable phosphat	e source in a ratio with calcium (Ca:	P) of 1.5–2.0. <sup>7</sup> American Academy of Pediat
Committee on Nutrit	on 2013 Guidelines recommend Ca	150-200 mg/kg/day (3.8-5 mmol/kg/day) a
75-140 mg/kg/day (2	.4-4.5 mmol/kg/day) and 200-400 IL	J/day of vitamin D for enteral nutrition in
preterm neonates. <sup>8</sup>		
P		
The event corum pho	spharus concentration at which to a	ommence supplementation of phosphate is
	-	
known and recomme	ndations vary from 1.3 mmol/L <sup>8</sup> to 2	L8 mmol/L. <sup>3</sup>
Metabolic bone dise	ase

## Phosphorus Newborn use only

	1	
	of elemental phosphorus per millimole. A dose of 10 to 20 mg/kg per day of elemental phosphorus is reasonable and will likely resolve hypophosphataemia in most preterm infants. <sup>8</sup>	
	Oral phosphorus and feeds	
	It is recommended to separate oral doses from calcium and antacids containing agents such as	
	aluminium hydroxide, calcium or magnesium salts, as these may reduce the bioavailability of phosphate.	
	Oral phosphate preparation has high osmolality and administration with feeds may have theoretical	
	benefit of reducing the osmolality (consensus opinion).
