# **DOBUTamine**

### **Newborn use only**

| Alert   |  |   |  |
|---|--|---|--|
|   | In conditions with low systemic vascular resistance (SVR) (e.g., septic shock) dobutamine is not the appropriate first drug of choice  |   |  |
| Indication  | Inotrope to increase cardiac output in neonates with myocardial dysfunction and un   |   |  |
|   | increased systemic vascular resistance.  |   |  |
| Action  | Catecholamine with beta-1 and beta-2 receptor actions which increases myocardial contractility, heart  |   |  |
|   | rate and conduction velocity and decreases SVR <sup>1</sup> .  |   |  |
|   | Dose dependent effects:  |   |  |
|   |  | ficant hemodynamic effects in neonates with cardiovascular  |  |
|   | compromise   |   |  |
|   | Moderate dose, 5–7.5 microgram/kg/min – increases cardiac output   |   |  |
|   | Higher dose, 5–20 microgram/kg/min – increases cardiac output and blood pressure in hypotensive protorm infants.   |   |  |
|   | preterm infants  An additional effect of dobutamine on increasing cardiac output has been demonstrated in hypotensive  |   |  |
|   | preterm infants receiving dopamine.  |   |  |
| Drug type   | Inotropic agent  |   |  |
| Trade name  | · -  | nine Sandoz, Dobutamine Hydrochloride DBL, Dobutrex   |  |
| Presentation  | 250 mg/20 mL solution for injection; 250mg   | •   |  |
| Dose  | 5–20 microgram/kg/minute   | , ,   |  |

|                  | succinylcholine, thiamine HCL, tobramycin, tolazoline, urokinase, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine.   |  |
| Incompatibility  | Fluids: Sodium bicarbonate, alkaline solutions, diluents that contain sodium bisulfite and ethanol.   |  |
|                  | Y site: <sup>10,11</sup> Aciclovir, alteplase, aminophylline, amphotericin B cholesteryl sulfate complex, amphotericin B conventional colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, azathioprine, benzylpenicillin, cefalotin, cefazolin, cefotaxime, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol sodium succinate, cloxacillin, dexamethasone, diazoxide, fluorouracil, folic acid (sodum salt), ganciclovir, heparin, hydrocortisone sodium succinate, ibuprofen lysine, indometacin, oxacillin, penicillin G potassium, penicillin G sodium, pentobarbital, phenobarbital, phenytoin, piperacillin, piperacillintazobactam, sodum bicarbonate, sugammadex, sulfamethoxazole-trimethoprim, ticarcillin, ticarcillinclavulanate  |  |
| Stability        | Reconstituted solution – Dobutrex brand only: Stable for 6 hours at 25°C and 24 hours at 2 to 8°C.  |  |
|                  | Diluted solution – other brands: Stable for 24 hours at 25°C.   |  |
|                  | Solutions may turn pink and colour will increase with time but with no significant loss of potency. Discard solutions that are hazy or contain particles.   |  |
| Storage          | Vial: Store below 25°C. Protect from light.  Discard remaining solution after use.  |  |
| Excipients       |   |  |
| Special comments | Dobutamine should always have a dedicated line to prevent accidental bolus.  A 1983 report by Kirschenbaum HL <sup>12</sup> observed change in colour when dobutamine was mixed with potassium chloride 20 meq/10 mL. However, Trissel's clinical pharmaceutical database on parenteral compatibility reports compatibility with potassium acetate and chloride. <sup>10</sup>  |  |
| Evidence         | Treatment of hypotension in preterm infants: Dobutamine is less effective than dopamine at increasing blood pressure in hypotensive infants but this may not change the clinical outcome. A single study <sup>2</sup> reported left ventricular output increased with dobutamine compared to a decrease with dopamine (LOE I, GOR C) <sup>3</sup> .  Treatment of low systemic blood flow: Dobutamine increased superior vena cava (SVC) flow with little change in blood pressure, whereas dopamine increased blood pressure with little change in SVC flow. There was no difference in clinical outcome (LOE II, GOR C) <sup>4-6</sup> .  Summary: Dobutamine is recommended to increase cardiac output in neonates with myocardial dysfunction and unchanged or increased systemic vascular resistance (SVR).  In conditions with low SVR (e.g., septic shock) dobutamine is not the appropriate first drug of choice <sup>1</sup> .  Safety  No evidence of an effect on the incidence of adverse neuroradiological sequelae (severe periventricular haemorrhage and/or periventricular leucomalacia), or on the incidence of tachycardia. Insufficient data confirming long term benefit and safety of dobutamine <sup>3</sup> . Common side effects reported were ventricular arrhythmias, tachycardia, hypotension and chest pain (children) (LOE III-2, GOR B) <sup>7</sup> . |  |
